THE OLIN CULTURAL INTELLIGENCE INVENTORY: Feedback Report

The *Olin Cultural Intelligence Profile (O-CIP)* was developed by Peter Boumgarden (2023), pulling together a set of measures from across the cultural intelligence landscape to aid Olin MBA/EMBA students in understanding how to engage across cultural differences. Your O-CIP scores can be useful as you work to understand better core elements of how you engage across cultural differences -- whether domestic or international -- and thus helpful as you develop as a global leader. A clear understanding of your cultural engagement style can be an important prerequisite for effective strategic management across differences.

As you consider your scores, remember that higher (or lower) scores are not necessarily better (or worse). The goal is self-awareness and personal understanding, not achieving a particular score.

This report is organized around the following sections:

Part 1: Bayesian Mindset

Part 2: Cultural Intelligence Scale

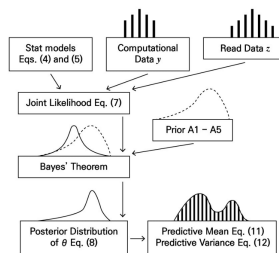

Part 3: Culture Mapping - Individual and Organizational

Part 4: Tight v. Loose Mindset

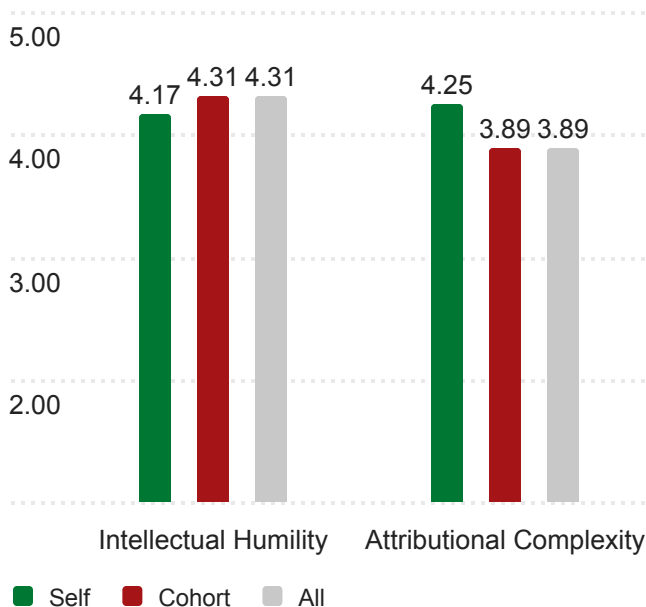

PART 1: YOUR BAYESIAN MINDSET

In our class together, we will talk about having a "Bayesian mindset," or what we will refer to the ability and willingness to update one's beliefs in response to new information rapidly. You can see a mathematical framing of that concept [below](#), whereby prior beliefs about the world are updated as new "data" comes into play.

To address this concept, we use three measures. The first is "Intellectual Humility," a measure developed by Leary and colleagues (2017) and which you can read about [here](#). Intellectual Humility assesses the extent to which you might recognize and accept that one's beliefs are incorrect. The second measure, "Attributional Complexity," which you can read more about [here](#), examines the extent to which you are open to more complex (or more simple) assessments of human behavior. The final measure is "Self-Monitoring," or your willingness to adjust how you show up in a social setting to match or mirror the expectations of others. This is scored from 0-1. Taken together, we suggest that higher scores on these three dimensions imply a natural tendency to update one's view of human behavior upon receiving new information. For the first two items, you will have your own score compared to the averages of others in your cohort and past participants (N = 27) who have taken this assessment. For behavior, it will compare your score versus that of your cohort.

Drivers of a Bayesian Perception

Drivers of Bayesian Behavior

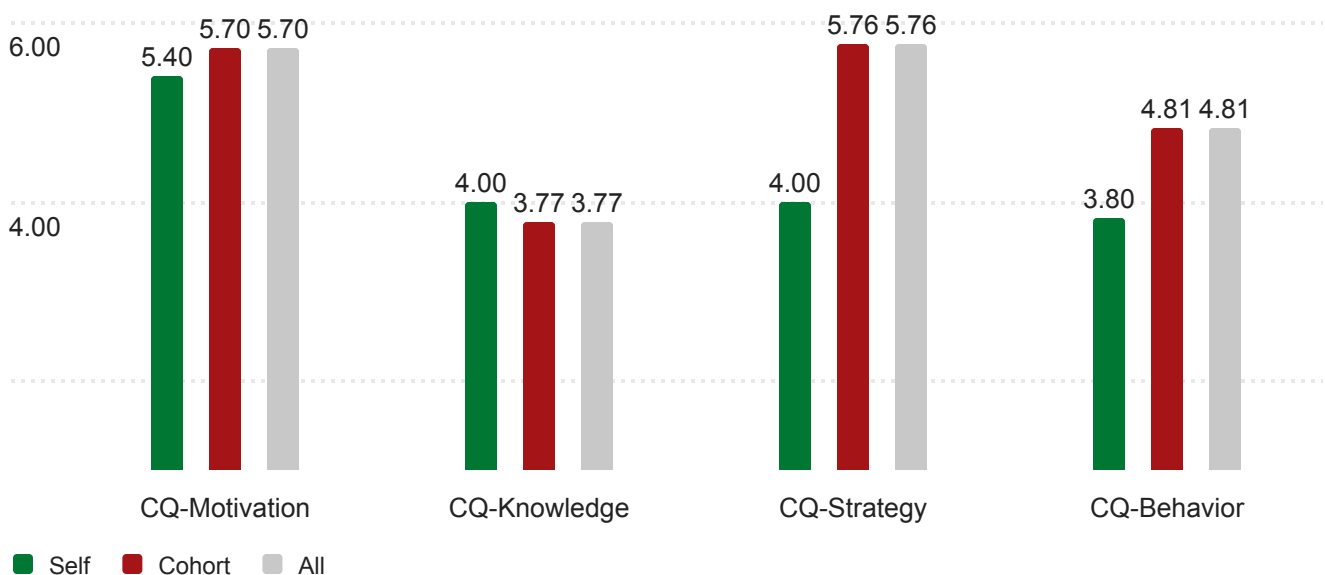

PART 2: YOUR CULTURAL INTELLIGENCE SCALE

The scores below offer another view of how you might understand your underlying cultural intelligence. The assessment was developed by Earley and Ang as they built on Sternberg and Detterman's multiple loci framework on intelligence to argue that intelligence must go beyond mere cognitive abilities. Ang and Van Dyne developed an initial nomological network of predictors and outcomes of the four key CQ capabilities:

- **CQ Drive (Motivational CQ):** the level of a person's interest, persistence, and confidence to function in culturally diverse settings.
- **CQ Knowledge (Cognitive CQ):** the level of a person's understanding of how cultures are similar and how they are different.
- **CQ Strategy (Meta-cognitive CQ):** the degree to which a person plans for, remains aware during, and checks after multicultural interactions.
- **CQ Action (Behavioral CQ):** the extent of a person's flexibility and appropriate use of a broad repertoire of behaviors and skills during multicultural encounters.

Shown below is a self-assessment of your own CQ relative to others in your cohort and past participants (N = 27) who have taken this assessment through the Bauer Leadership Center, assessed on a seven-point scale. These are general measures and do not hit at particular differences. This might be especially relevant with CQ-Knowledge (e.g., "I know a lot about individuals from South Africa, but not a lot about cultural differences in general")

Cultural Intelligence Scale

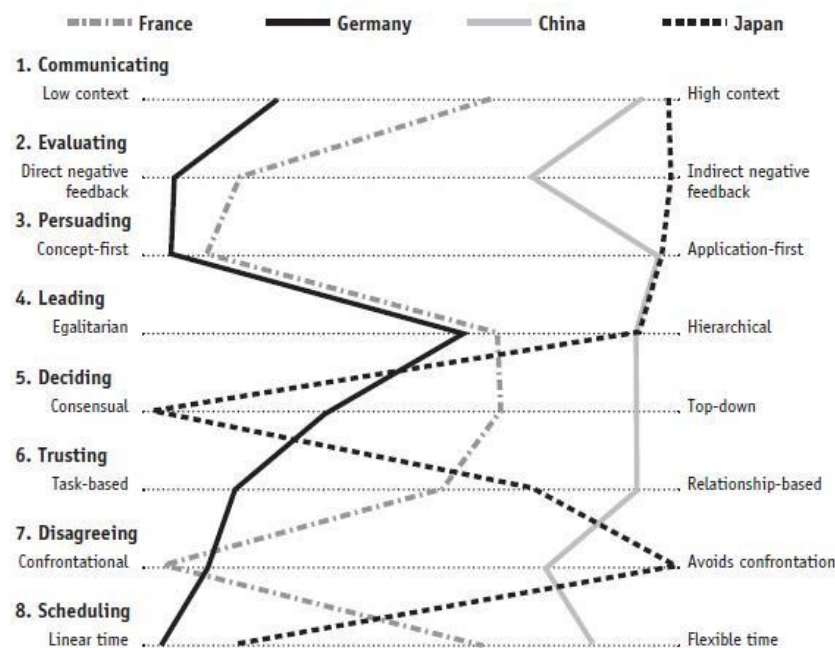

PART 3: YOUR CULTURE MAPPING - INDIVIDUAL AND ORGANIZATIONAL

The assessment below builds upon Erin Meyer's work on culture maps. To get individual maps by country, like you see below, I would encourage you to look at her [website](#). In our use of the tool, we first have you assess your natural tendencies, which are then shown against your cohort and past participants (N = 27) who have taken this assessment through the Bauer Leadership Center.

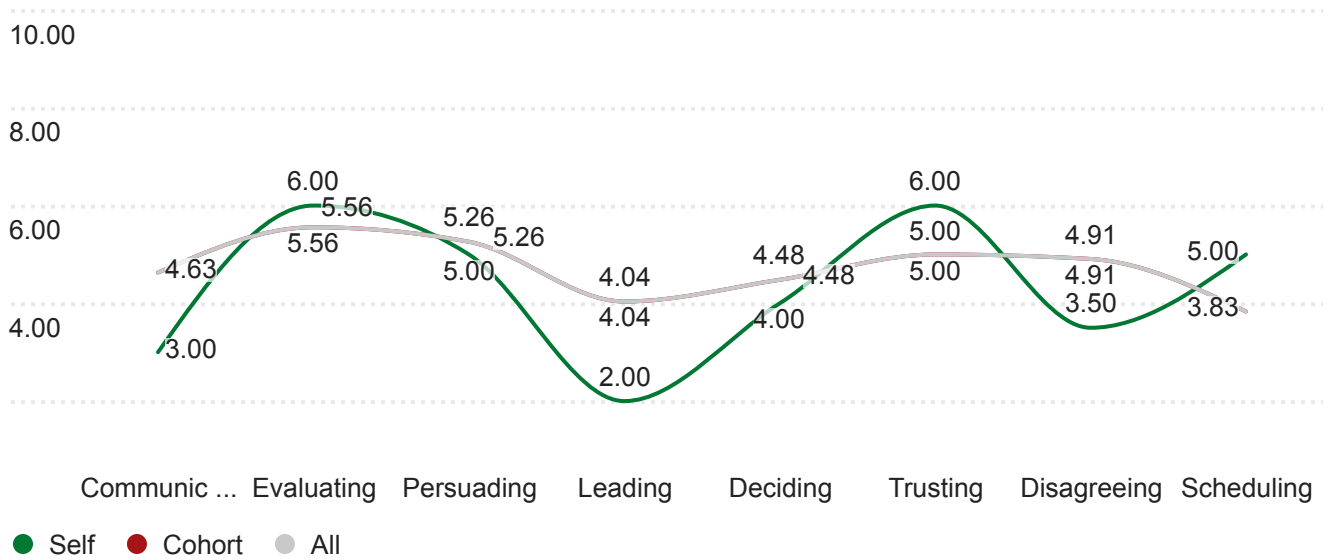

We then have you assess your company and map those scores against your measures. The latter approach provides a way to think about potential cultural tensions within your organization -- differences between how you work naturally and your company's working culture. For each item, higher scores imply scores further to the right on the chart below (e.g., 10 = high context communication, 1 = egalitarian leadership).

- **Communicating:** low-context vs high-context
- **Evaluating:** direct negative feedback vs indirect negative feedback
- **Persuading:** principles-first vs applications-first
- **Leading:** egalitarian vs hierarchical
- **Deciding:** consensual vs top-down
- **Trusting:** task-based vs relationship-based
- **Disagreeing:** confrontational vs avoids confrontation
- **Scheduling:** linear-time vs flexible-time

For a good framing of the application of this work to a company level, take a look at Erin's [No Rules Rules](#) book with Netflix founder Reid Hastings, called [No Rules Rules](#), from which the figure below is drawn.

Culture Map - My Style Versus My Organization's Style

■ My Communication

Culture Map - Current Organizational Style versus Ideal Organization for Performance

■ Ideal Org's Comm

PART 4: ASSESSING YOUR PERSONAL TIGHTNESS v LOOSENESS

The final assessment looks at work on tightness and looseness from an individual standpoint. As Michelle Gelfand reminds [us](#), "How intensely you adhere to social norms has major implications for your life. This level of intensity falls on a spectrum from very loose to very tight. Knowing how tight or loose you are can help you understand yourself and others better."

This concept was developed by Michele Gelfand, and is explicated in her book [Rule Makers, Rule Breakers](#). Unlike the assessment at a state or company level, this score looks at your individual mindset. In the language of Gelfand, the ways to understand tightness can be seen by paying attention to the following three questions.

1. How much do you notice the norms around you and the expectations that people have of you?
2. Do you tend to be cautious and controlled, or adventurous and impulsive?
3. Are you a creature of habit—preferring structure and social order—or do you enjoy situations that are less structured?

Gelfand, Michele. *Rule Makers, Rule Breakers: How Tight and Loose Cultures Wire Our World* (p. 182).

On the scoring below, you will have a score of tightness mindset (between 1 and 5), whereby higher scores imply higher tightness, and thus greater attention to and value placed on finding fit within guiding social norms of a situation.

In this tool, we first have you assess your natural tendencies, which are then shown against your cohort and past participants (N = 27) who have taken this assessment through the Bauer Leadership Center.

Tightness v Looseness as an Individual Mindset
